In today's society we increasingly create and consume written content and images. This includes a range of sources, from social media posts to records held within organisations, and everything in between, including news articles, blogs, shopping lists and official government documents. Critically reading these 'documents' can help us to understand a huge amount about society. Doing

Excellent Social Research with Documents includes guidance on how to 'read between the lines', and provides an overview of six research projects which use documents as data. The substantive chapters are organised in two sections, with each chapter focused on a specific type of data. Section one focuses on documents that are found in isolation from their authors, including official and historical documents, traditional media, diaries and online content. Section two focuses on using documents in addition to existing data from primary research, including the role of documents in

ethnography and visual research methods. In each chapter, you will be guided through the process of: Developing research questions, and how this impacts on which documents are selected; Considering aspects of bias and quality within the documentary sources; Undertaking analysis using six different strategies including thematic analysis, framework analysis, content analysis, discourse analysis and narrative analysis. Drawing on research projects which reflect real world situations, you will be methodically guided through the research process in

detail, enabling you to examine and understand the practices and value of a range of documentary analysis approaches. Doing Excellent Social Research with Documents is a practical how-to guide for students (final year undergraduates onwards) and researchers using documents as data. Revised and expanded to reflect the most recent innovations in the field, The Scientific Examination of Documents, Fourth Edition is a handy, accessible volume detailing current best-practices for forensic document examination. Since the first edition published in 1989, there have been

drastic changes in the field of forensic document examination—both from the use of the analytic techniques available to the professional examiner—and the changes to technology in office and printing equipment and inks. The purpose of analyzing any material used in the production of a questioned document, such as an ink or a piece of paper, is to compare it with another material elsewhere in the questioned document itself—or on another document—to determine whether or not they share a common origin. There may also be a need to provide information for the

investigator about the possible origins of the document. This latest edition reflects the myriad changes and advances that have occurred in the last 10 to 15 years. Topics covered include: current thinking on handwriting interpretation; accidental and deliberate modification of handwriting; the proper collection of samples; a discussion of shredded documents; professional accreditation standards, qualifications, and training; and modern digital imaging and analysis of documents and handwriting utilizing software

and imaging, including reconstruction of an image from erasures, obliteration and other document altering methods. A new section addresses cognitive bias and Chapter 8 is completely updated to cover the advances in print and photocopied documents, based on current technology, and analytical developments in the comparison of such documents. Key features: Discusses issues regarding handwritten, photocopied, and printed documents—including inkjet versus digital printing Presents the advances and capabilities modern

office fax, photocopy, and printing technologies—and implications for document examination Details and reinforces the importance of ensuring proper scientific methods during an examination Addresses current Raman spectroscopy, UV-VIS, mass spectroscopy, and SEM analysis techniques Highlights the importance, and implications, of biological and fingerprint evidence from documents that can be collected, examined, and utilized in a case The Scientific Examination of Documents, Fourth Edition serves as an

invaluable resource to established professionals, those just entering the field, and legal and investigative professionals outside the discipline who have a professional interest dealing with questioned documents in the course of their work. This book constitutes the refereed proceedings of the 13th International Conference of the CLEF Association, CLEF 2022, held in Bologna, Italy in September 2022. The conference has a clear focus on experimental information retrieval with special attention to the challenges of multimodality, multilinguality, and interactive search

ranging from unstructured to semi structures and structured data. The 7 full papers presented together with 3 short papers in this volume were carefully reviewed and selected from 14 submissions. This year, the contributions addressed the following challenges: authorship attribution, fake news detection and news tracking, noise-detection in automatically transferred relevance judgments, impact of online education on children’s conversational search behavior, analysis of multi-modal social media content, knowledge graphs for sensitivity

identification, a fusion of deep learning and logic rules for sentiment analysis, medical concept normalization and domain-specific information extraction. In addition to this, the volume presents 7 "best of the labs" papers which were reviewed as full paper submissions with the same review criteria. 14 lab overview papers were accepted and represent scientific challenges based on new datasets and real world problems in multimodal and multilingual information access. "This book is tailored to the needs of those studying for version 4.0 of the Architect Registration Examination"--P. v.

Theodore Gray's Elements Vault builds on Gray's best-selling book with all new text, plus removable historic letters and other artifacts and collectible samples of real elements. The Elements Vault picks up where The Elements left off. Organized into the nine major groups of the periodic table, including the alkali metals, the alkali earth metals, the transition metals, the nonmetals, the metalloids, the halogens, the noble gases, the actinides, and the lanthanides, Elements Vault includes all new

text, new photographs, and even more information about the elements. Elements Vault also includes 20 removable historic documents related to the elements and the field of chemistry, such as Einstein's famous letter to Roosevelt explaining the potential of uranium for use in nuclear weapons, a genuine advertisement for lithium-laced 7UP soda, Mendeleev's original notes on the periodic table, and more. Each of these documents is individually packaged in an envelope attached to the book page. The document can be removed and handled and then put back into the

book for safekeeping. Also here is a gorgeous 20" x 10" poster of the unique rainbow spectrum emitted by each element in the periodic table. Also included inside the book are real samples of pure elements! Filled with Theo Gray's and Nick Mann's trademark stunning photography throughout, Elements Vault is the perfect addition to Gray's growing series of all-things-elements. Explains how to build useful tools for searching collections of text and other media. The third edition of Uwe Flick's bestselling textbook has been fully revised, expanded and updated while retaining all of the student-friendly

elements and carefully structured qualities of the previous editions. This book focuses on the specific mission planning for lunar sample collection, the equipment used, and the analysis and findings concerning the samples at the Lunar Receiving Laboratory in Texas. Anthony Young documents the collection of Apollo samples for the first time for readers of all backgrounds, and includes interviews with many of those involved in planning and analyzing the samples. NASA contracted with the U.S. Geologic Survey to perform classroom and field training of the Apollo astronauts.

NASA's Geology Group within the Manned Spacecraft Center in Houston, Texas, helped to establish the goals of sample collection, as well as the design of sample collection tools, bags, and storage containers. In this book, detailed descriptions are given on the design of the lunar sampling tools, the Modular Experiment Transporter used on Apollo 14, and the specific areas of the Lunar Rover vehicle used for the Apollo 15, 16, and 17 missions, which carried the sampling tools, bags, and other related equipment used in sample collection. The Lunar Receiving

Laboratory, which was designed and built at the Manned Spacecraft Center in Texas for analysis and storage of the lunar samples returned from the Apollo lunar landing missions is also described in detail. There are also descriptions of astronaut mission training for sample collecting, with the focus on the specific portions of the mission EVAs devoted to this activity. perform calculations for the examples in SDA. No prior experience with R is needed. Chapter 1 tells you how to obtain R and RStudio, introduces basic features of the R statistical software environment, and helps you get started with analyzing data. Each subsequent chapter provides step-by-step guidance for working through the data examples in the corresponding chapter of SDA, with code, output, and interpretation. Tips and warnings help you develop good programming practices and avoid common survey data analysis errors. R features and functions are

introduced as they are needed so you can see how each type of sample is selected and analyzed. Each chapter builds on the knowledge developed earlier for simpler designs; after finishing the book, you will know how to use R to select and analyze almost any type of probability sample. All R code and data sets used in this book are available online to help you develop your skills analyzing survey data from social and public opinion research, public health, crime, education, business, agriculture, and ecology. Vols. for 1942- include proceedings of the American Physiological

Society. Data mining is a mature technology. The prediction problem, looking for predictive patterns in data, has been widely studied. Strong methods are available to the practitioner. These methods process structured numerical information, where uniform measurements are taken over a sample of data. Text is often described as unstructured information. So, it would seem, text and numerical data are different, requiring different methods. Or are they? In our view, a prediction problem can be solved by the same methods, whether the data are structured - merial

measurements or unstructured text. Text and documents can be transformed into measured values, such as the presence or absence of words, and the same methods that have proven successful for predictive data mining can be applied to text. Yet, there are key differences. Evaluation techniques must be adapted to the chronological order of publication and to alternative measures of error. Because the data are documents, more specialized analytical methods may be preferred for text. Moreover, the methods must be modified to accommodate very high dimensions: tens of thousands of

words and documents. Still, the central themes are similar.
