Special edition of the Federal Register, containing a codification of documents of general applicability and future effect ... with ancillaries. The OECD Secretariat has developed a multi-region, multi-sector, dynamic applied general equilibrium (AGE) model to quantify the economy-wide and global costs of policies to curb emissions of carbon dioxide (CO₂). The project is called the GeneRal Equilibrium ENvironment model, hereafter referred to as GREEN. The purpose of this paper is to provide a full technical description of the GREEN model, its data base and parametrisation as of April 1992. It replaces the previous version of the GREEN Technical Manual which was issued in June 1991 as Working Paper No. 104 ... As is now generally accepted mankind's burning of fossil fuels has resulted in the mass transfer of greenhouse gases to the atmosphere, a modification of the delicately-balanced global carbon cycle, and a measurable change in worldwide temperatures and climate. Although not the most powerful greenhouse gas, carbon dioxide (CO₂) drives climate change due to the enormous volumes of this gas pumped into the atmosphere every day. Produced in almost equal

parts by the transportation, industrial and energy-generating sectors, atmospheric CO₂ concentrations have increased by about 50% over the last 300 years, and according to some sources are predicted to increase by up to 200% over pre-industrial levels during the next 100 years. If we are to reverse this trend, in order to prevent significant environmental change in the future, action must be taken immediately. While reduced use of fossil fuels (through conservation, increased efficiency and expanded use of renewable energy sources) must be our ultimate goal, short to medium term solutions are needed which can make an impact today. Various types of CO₂ storage techniques have been proposed to fill this need, with the injection of this gas into deep geological reservoirs being one of the most promising. For example this approach has the potential to become a closed loop system, whereby underground energy resources are brought to surface, their energy extracted (via burning or

hydrogen extraction), and the resulting by-products returned to the subsurface. Carbon dioxide (CO₂) capture and storage (CCS) is the one advanced technology that conventional power generation cannot do without. CCS technology reduces the carbon footprint of power plants by capturing, and storing the CO₂ emissions from burning fossil-fuels and biomass. This volume provides a comprehensive reference on the state of the art research, development and demonstration of carbon storage and utilisation, covering all the storage options and their environmental impacts. It critically reviews geological, terrestrial and ocean sequestration, including enhanced oil and gas recovery, as well as other advanced concepts such as industrial utilisation, mineral carbonation, biofixation and photocatalytic reduction. Foreword written by Lord Oxburgh, Climate Science Peer

Comprehensively examines the different methods of storage of carbon dioxide (CO₂) and the various concepts for utilisation Reviews

geological sequestration of CO₂, including coverage of reservoir sealing and monitoring and modelling techniques used to verify geological sequestration of CO₂ Over the past decade, the prospect of climate change resulting from anthropogenic CO₂ has become a matter of growing public concern. Not only is the reduction of CO₂ emissions extremely important, but keeping the cost at a manageable level is a prime priority for companies and the public, alike. The CO₂ capture project (CCP) came together with a common goal in mind: find a technological process to capture CO₂ emissions that is relatively low-cost and able to be expanded to industrial applications. The Carbon Dioxide Capture and Storage Project outlines the research and findings of all the participating companies and associations involved in the CCP. The final results of thousands of hours of research are outlined in the book, showing a successful achievement of the CCP's goals for lower cost CO₂ capture technology and

furthering the safe, reliable option of geological storage. The Carbon Dioxide Capture and Storage Project is a valuable reference for any scientists, industrialists, government agencies, and companies interested in a safer, more cost-efficient response to the CO₂ crisis. In 1990 the Beretta M9 replaced the venerable Colt 1911 as the main pistol of choice for the US Army. At the time the decision was controversial particularly because it was perceived that a smaller caliber weapon such as the Beretta would lack the necessary stopping power and range in comparison to the .45 caliber Colt. The situation was not helped by the rumour that the adoption of this Italian designed pistol was in exchange for the creation of US missile bases within Italy. Nonetheless, the Beretta, although not a perfect pistol, has since proved many of its detractors wrong with widespread use in Iraq and Afghanistan. Written by a leading pistol expert who currently trains

US Special Forces in the use of this weapon, this book is an honest appraisal of the successes and failings of the Beretta design. The volume traces the Beretta designs, which preceded the M9 as well as its use on the battlefield, including the impact it has had on close combat training due to the larger magazine capacity. It also details the adoption of the Beretta by US law enforcement agencies and the impact this has had. This is a fascinating history of a classic pistol and its future use.
