Gifts for car guys? Car enthusiasts gifts? This is the perfect funny birthday gift or a fun present product for family & friends who can never have enough wheels in their life! Let them show the world their obsession with driving cars, they'll love it! Consider purchasing this if you're looking for products related to funny car lover for those people that spend all their money to trick out their rides that they likely spend a lot of time in each day during their commute. Get it now for yourself! This is the perfect Journal to track your life. Track everything starting with your travel destinations, experiences with friends, thankful moments or successes. You get 120 pages for easy notes and scribbles. Please check out our other Journals. *Alarm Systems and Theft Prevention, Second Edition*, recounts the sometimes sad, sometimes humorous, and nearly always unfortunate experiences of manufacturers, distributors, retailers, and individuals who have lost valuable merchandise, money, jewelry, or securities to criminal attacks. In most cases the losses occurred because there was a weak link: a vulnerability in the total security defense. The book presents in practical terms those weaknesses in physical security, alarm systems, or related security procedures that, when blended

together, result in vulnerability. In addition to analyzing these cases and identifying the key elements of vulnerability, remedies for curing the weakness are also offered. Other sections of this book deal with the application, strengths, and limitations of security equipment. For the most part, equipment is presented from the practical viewpoint—what a security device or system will do (or not do) and how it should be applied and operated, rather than the detail of mechanical design, electrical circuitry, or laboratory theories. This book is written in layman's language and is intended to be read by people who supply, use, or need security services and equipment. The research was prompted as a result of increasing rate of car theft in every part of the world which has reached an alarming rate. This research was to provide a lasting solution to the rate at which cars are being stolen by exploring the GSM technology coupled with some digital control techniques as possible remedy. This book will familiarize every reader to the design and practice of the car anti-theft system via GSM network. Aside from the drawback of inconsistency in the availability of GSM network in most part of the world, the project will be an revolutionary improvement in the defense and security sector of the country. Blank 150 page lined journal for your thoughts, ideas, and inspiration. Discusses whether automobile insurers offer anti-theft discounts for owners who install the “Lo-Jack” anti-theft system in their vehicle. This is the perfect Journal to track your life. Track everything starting with your travel destinations, experiences with friends, thankful moments or successes. You get 120 pages for easy notes and scribbles. Please check out our other Journals. This journal is a perfect gift for friends and family male or female. Other features of this notebook are: - 120 pages - 6x9 inches - matte cover This book is convenient for writing. It has the perfect size to carry anywhere for journaling and note taking. Final year

report -- Elektriase, Elektroniese & Rekenaaringenieurswese.  
Diploma Thesis from the year 2022 in the subject Engineering -  
Automotive Engineering, grade: 4th, , course: Automotive, language:  
English, abstract: The research study aims to determine the  
effectiveness of a vehicle's Call & SMS Alert System. Significantly,  
it aims to: design and development of call & SMS notification for  
anti-theft system and develop and integrate the design elements of the  
device. Technology innovations and inventions have brought benefits  
to human beings. With the fast advancement of technology in recent  
years, an increasing number of intelligent technology systems have  
used computer vision and pattern recognition algorithms. Many  
common problems, like vehicle theft, can be resolved using these  
technology systems. Vehicle theft, like vehicle hijacking, is a  
frequent problem in the Philippines and internationally. Vehicle  
hijacking has been an increasingly serious problem over the last and  
recent decade. The rate of hijackings is higher in locations where a  
car is financially out of reach but nonetheless a need or status symbol.  
According to E.T Exclusivethesis, these days' hijackers are armed  
with dangerous and fatal weapons in 90% of the incidents. Typically,  
there is no need to deploy the weapons because the sheer sight of  
them causes the ordinary individual to abandon their car. But the  
weapons aren't just for show; car hijackers aren't scared to use them,  
and then just 1% of car hijackings result in a fatality. Hijackers see  
cars and steal them quickly, they can sell them and bring several  
thousand dollars in minutes or second, hijackers are heartless and  
ruthless criminals and are provoked not by the hurt they cause in  
other people but by greed for money and the thrill of stealing a car  
from a total stranger. The rise in car hijacking is complex stemming  
from a variety of social issues coupled with difficult economic times.  
Cars are growing more expensive, even though they are becoming

less necessary in one's life. People rely on their autos for mobility, and many car owners would be unable to tell you what public transit options are available to get them to the same areas. They are "crimes of opportunity" committed by people who need to satiate their fix or other desperate people. This report is an outcome of the work I have carried out in doing and completing my final year project, the Anti Theft Design of Car Seat. This report presents a new anti theft design of car seat prototype designed for the automatic car locking system, with attention on user's safety and surrounding impact. The overall task is analyzed and proper suggestions are developed to organize the operation of new type car lock system which will use a car seat as a locking medium. The report starts off with an introduction on car anti theft system and car lock system. Then a further introduction describe on the important of the car lock and its advantages towards car safety. Based on the information, a design of new seat model is made. Several sketches have been made and only a few have been selected based on the suitability of the system. Besides, material needed in this project will be listed and the system used will be selected. Next all the sketches will be draw into CATIA software .Each part of the new model are tested using finite element method to make sure that the strength and stiffness of the seat unit are suitable for everyday usage. The seat are design to be fully automated seat, thus the control system of the seat movement are made. This project is successfully completed when final model has proved to be fulfilling nearly every factor that needed in anti theft system and car seat system. This is the perfect Journal to track your life. Track everything starting with your travel destinations, experiences with friends, thankful moments or successes. You get 120 pages for easy notes and scribbles. Please check out our other Journals. This book is aimed at building a secured and reliable vehicle anti-theft system which will have the ability to ac-

cess the vehicle subsystems from a remote location where there is GSM network. And also, the design method involves the interfacing of GSM/GPRS modem module with the vehicle ignition subsystem, and the test result shows that it performs some control actions on the vehicle subsystems from a mobile phone, having taken the advantage of the wide coverage area of some GSM networks. Hence the topic is "Remotely Controlled Vehicle Anti-theft System via GSM Network." Vehicle theft is a universal problem. The statistic of the vehicle gets stolen or vandalized increases at an alarming rate every year. For example in Malaysia alone, for the year 2004, it was reported that about 26,566 cars were stolen which represents about 33% increases compared to the statistic of the same period of the previous year. This will lead to an increase in the vehicle insurance premium which has to be paid by the consumers. Therefore, it can be concluded that the security systems installed by the vehicle manufacturer are not effective enough. To solve this problem, a wireless vehicle security system which implements mobile communication protocol is proposed. The control and communication between the user and the proposed system are achieved through a short message services (SMS) protocol available in the cellular phone. The proposed system is interfaced with an immobilizer and a remote keyless entry system. The proposed system is capable of informing the user through the user's cellular phone if the car is vandalized, tampered or stolen by an intruder. At the same time the remote keyless entry system and the immobilizer systems will activate the alarm. The system will produce human voice instead of producing an alarm sound. By using the proposed system, the user is also capable of controlling the car's door remotely. The effective communication coverage of this system is based on the user's cellular phone coverage. The proposed system consists both hardware and software parts. The hardware components

include a microcontroller, an immobilizer, a remote keyless entry (RKE) system, a GSM modem, a voiced-alarm module, a cellular phone and a remote control of RKE system. The software part includes a program controller interface. The result of simulation and practical tests conducted on the proposed system, demonstrate that the proposed system is successfully designed and fabricated. Global System for Mobile Communications (GSM) seems to be the best solution to develop outdoor alerting system, but performance of these systems is not good enough to local entities within indoor environments, mainly if accuracy and precision are required. With the technology of Radio frequency identification (RFID) and GSM, many researches are being carried out on monitoring entities as it does provide accuracy and precision. Plus, the technology is applicable to develop new variation of identification, and anti-theft system. Accordingly, in this project, we propose an anti-theft system combining GSM and RFID technology that is able to accurately monitor and alert various valuable entities. The proposed system can alert the user when the entities moved out of the define parameters and then the system can notify the owner by sending message when the entities moved out of the parameter. Lined Notebook Journal Millennial Anti Theft System Funny Muscle Car . This Lined Notebook Journal Millennial Anti Theft System Funny Muscle Car is a great way to cultivate a better you. This Lined Notebook Journal Millennial Anti Theft System Funny Muscle Car makes a great back to school, Christmas Gift holiday, graduation, beginning of the school year gift for family, friends, your mother, sister, girlfriend, girl, boy, children
